Fine-tuning collective, wireframe v0.2

Cleaned-up version of the hand-drawn v0.1. Adds a training step, a decision node with two feedback paths, a shared task spec, contamination checks and a final output.

From v0.1 | New or changed in v0.2 | Stretch goal

What changed from v0.1

Trainer step added

v0.1 went from data straight to evaluation

Decision node with two loops

Data problems go back to L1; training

Shared task spec

M1 now outputs one structured spec that both

v0.1 went from data straight to evaluation. The Trainer turns the JSONL into a LoRA adapter.

M4 is a script
Formatting is deterministic, so it doesn't need an LLM.

Data problems go back to L1, training problems only change hyperparameters, which is much faster.

Benchmark protection
Contamination check against benchmark items, a held-out split, and feedback that names failure categories, not test items.

M1 now outputs one structured spec that both L1 and L2 read.

Retry caps and output
Generate/verify loops capped at 2 retries; stop criteria and final deliverables are explicit.
